to Article 29 of the Regulation (EU)
No 305/2011 of the European
Parliament and of the Council of 9
March 2011

MEMBER OF EOTA

European Technical Assessment ETA-13/0026 of 2021/06/25

I General Part

Technical Assessment Body issuing the ETA and designated according to Article 29 of the Regulation (EU) No 305/2011: ETA-Danmark A/S

Trade name of the construction product:

BB Stanz- und Umformtechnik GmbH post bases

Product family to which the above construction product belongs:

Three-dimensional nailing plate (Post bases)

Manufacturer:

BB Stanz- und Umformtechnik
Nordhäuser Str. 44
D-06536 Berga
Tel. +49 34651 2988 0
Fax +49 34651 2988 20
Internet www.bb-berga.de

Manufacturing plant:

BB Stanz- und Umformtechnik

This European Technical Assessment contains:

65 pages including 2 annexes which form an integral part of the document

This European Technical Assessment is issued in accordance with Regulation (EU) No 305/2011, on the basis of:

EAD 130186-00-0603 for Three-dimensional nailing plates

This version replaces:

The ETA with the same number issued on 2018-08-23

Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and should be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full (excepted the confidential Annex(es) referred to above). However, partial reproduction may be made, with the written consent of the issuing Technical Assessment Body. Any partial reproduction has to be identified as such.

II SPECIFIC PART OF THE EUROPEAN TECHNICAL ASSESSMENT

1 Technical description of product and intended use

Technical description of the product

The BB Stanz- und Umformtechnik post bases are made from 2.0 mm to 8.0 mm thick steel plates in combination with steel tubes and rods. The post bases are produced of steel grade S235JR according to EN 10025-2 with a minimum characteristic yield strength of $R_{eH} = 235 \text{ N/mm}^2$ and a minimum characteristic tensile strength of $R_m = 360 \text{ N/mm}^2$ and steel grade DD11 according to EN 10111-2 with a minimum characteristic yield strength of $R_{eL} = 170 \text{ N/mm}^2$. The steel tubes are produced of steel grade S195T according to DIN EN 10255 with a minimum characteristic yield strength of $R_{eH} = 195 \text{ N/mm}^2$ and a minimum characteristic tensile strength of $R_m = 320 \text{ N/mm}^2$. The steel rods are produced of steel grade S235JRC+C according to EN 10277-2 with a minimum characteristic yield strength of $R_{p0,2} = 260 \text{ N/mm}^2$ and a minimum characteristic tensile strength of $R_m = 390 \text{ N/mm}^2$. The threaded rods correspond to property class 4.8 according to DIN EN ISO 898-1.

For the connections with metal fasteners dowels ø10 mm (S235) or bolts ø10 mm (4.6) and screws ø12x120 mm, ø10x100 mm, ø10x80 mm; ø10x50 mm or ø6x80 mm according to EN 14592 (DIN 571 and thread according to DIN 7998) with a minimum characteristic tensile strength of $R_m = 360 \text{ N/mm}^2$ or according to an ETA are used. The screws shall be driven into pre-drilled holes according to EN 1995-1-1, 10.4.5 or respectively according to the ETA of the screws.

Dimensions are shown in Annex A and B.

2 Specification of the intended use in accordance with the applicable European Assessment Document (hereinafter EAD)

The intended use of the post bases is the support of timber columns and posts as load-bearing elements, where requirements for mechanical resistance and stability and safety in use in the sense of the Basic Works Requirements 1 and 4 of Regulation (EU) 305/2011 shall be fulfilled.

The static and kinematical behaviour of the timber members or the supports shall be as described in Annex B.

The timber posts may be of solid timber of strength class C24 or better according to EN 338:2016 or of

glued laminated timber according to EN 14080:2013. Minimum dimensions for the post have to be considered (Annex A).

The post base shall be installed as pictured in the drawings. The cross-section of the timber column shall be positioned centrally and with the end grain plane on the base plate. The end grain of the timber post must in general be plane on the base plate of the post base. Post bases types H have a distance between the end grain of the timber post and the base plate of the post base up to 10 mm due to constructive wood preservation.

The maximum distance between the foundation and the base plate of the post base is given in Annex A, table A.1.

Annex B states the load-carrying capacities of the post bases for solid timber of strength class C24 according to EN 338:2016. The design of the connections shall be in accordance with Eurocode 3 and Eurocode 5 or a similar national code. The anchorage of the post base in the foundation and imperfections exceeding the assumptions in Eurocode 5, 5.4.4 are not part of this ETA.

The post bases are for use in timber structures subject to the service classes 1, 2 and 3 of Eurocode 5 and for connections subject to static or quasi-static loading. In service class 1 and 2 the corrosion protection is given by hot-dip zinc coating Z275 according to EN 10147 or zinc coating according to EN1461 with a minimum thickness of 8 µm. In service class 3 the corrosion protection is given by hot-dip zinc coating Z350 according to EN 10147 or zinc coating according to EN1461 with a minimum thickness of 55 µm.

The metal fasteners must also have a zinc coating according to EN ISO 2081 corresponding to the relevant service class 1, 2 or 3 of EN 1995-1-1. Galvanic zinc coating of the post bases is only suitable for service classes 1 and 2.

The scope of the hangers regarding resistance to corrosion shall be defined according to national provisions that apply at the installation site considering environmental conditions.

The provisions made in this European Technical Assessment are based on an assumed intended working life of the post bases of 50 years.

The indications given on the working life cannot be interpreted as a guarantee given by the producer or Assessment Body, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

Characteristic	Assessment of characteristic
3.1 Mechanical resistance and stability*) (BWR1)	
Characteristic load-carrying capacity	See Annex B
Stiffness	No performance assessed
Ductility in cyclic testing	No performance assessed
3.2 Safety in case of fire (BWR2)	
Reaction to fire	The post bases are made from steel classified as Euroclass A1 in accordance with EN 13501-1 and Commission Delegated Regulation 2016/364
3.3 General aspects related to the performance of the product	
Identification	See Annex A

*) See additional information in section 3.4 – 3.6.

3.4 Mechanical resistance and stability

Safety principles and partial factors

The characteristic load-carrying capacities are based on the characteristic values of the connections with metal fasteners, the steel components and the timber post.

In the case of timber failure or failure of the metal fasteners, the design values shall be calculated according to EN 1995-1-1 by dividing the characteristic values of the load-carrying capacities by different partial factors for the strength properties, and in addition multiplied with the coefficient k_{mod} .

In the case of steel failure, the design value shall be calculated according to EN 1993-1-1 by reducing the characteristic values of the load-carrying capacity with different partial factors.

The design value of the load-carrying capacity is the smaller value of all load-carrying capacities:

$$F_{\text{Rd}} = \min \left\{ \frac{k_{\text{mod}} \cdot F_{\text{Rk,T}}}{\gamma_{M,T}} ; \frac{F_{\text{Rk,S}}}{\gamma_{M_i,S}} \right\}$$

Therefore, for timber failure or failure of the metal fasteners the load duration class and the service class are included. The different partial factors γ_M for steel or timber failure, respectively, are also correctly taken into account

Mechanical resistance and stability

See Annex B for the characteristic load-carrying capacity in the different directions F_1 to F_5 for solid timber of strength class C24 according to EN 338:2016. Using the load-carrying capacities of the post bases, the specifications in Annex A must be fulfilled.

The characteristic capacities of the post bases are determined by a combination of calculation according to Eurocode 3 and Eurocode 5 and testing. They should be used for designs in accordance with Eurocode 3 and Eurocode 5 or a similar national code.

No performance has been determined in relation to ductility of a joint under cyclic testing. The contribution to the performance of structures in seismic zones, therefore, has not been assessed.

No performance has been determined in relation to the joint's stiffness properties - to be used for the analysis of the serviceability limit state.

No performance has been determined in relation to the anchorage of the post bases in the foundation. It must be checked by the designer of the structure to ensure it

is not less than the post base capacity and, if necessary, the post base capacity reduced accordingly. Therefore the specifications for the lever arms $e_{F2/F3}$ (for load case F_2 / F_3) and $e_{F4/F5}$ (for load case F_4 / F_5) in annex A have to be considered. The lever arm is the distance between the top edge of the foundation and the load.

3.5 Aspects related to the performance of the product

2.7.1 Corrosion protection in service class 1 and 2.

In accordance with EAD 130186-00-0603 the post bases are produced from steel grade S235JR according to EN 10025-2:2005-04 with a minimum characteristic yield strength of $R_{eH} = 235 \text{ N/mm}^2$ and a minimum characteristic tensile strength of $R_m = 360 \text{ N/mm}^2$ and steel grade DD11 according to EN 10111-2:2008 with a minimum characteristic yield strength of $R_{eL} = 170 \text{ N/mm}^2$. The steel tubes are produced of steel grade S195T according to DIN EN 10255:2007 with a minimum characteristic yield strength of $R_{eH} = 195 \text{ N/mm}^2$ and a minimum characteristic tensile strength of $R_m = 320 \text{ N/mm}^2$. The steel rods are produced of steel grade S235JRC+C according to EN 10277-2:2008-06 with a minimum characteristic yield strength of $R_{p0,2} = 260 \text{ N/mm}^2$ and a minimum characteristic tensile strength of $R_m = 390 \text{ N/mm}^2$. The threaded rods correspond to property class 4.8 according to DIN EN ISO 898-1:2009-08

The post bases are for use in timber structures subject to the service classes 1, 2 and 3 of Eurocode 5 and for connections subject to static or quasi-static loading. In service class 1 and 2 the corrosion protection is given by hot-dip zinc coating Z275 according to EN 10147 or zinc coating according to EN1461 with a minimum thickness of 8 μm . In service class 3 the corrosion protection is given by hot-dip zinc coating Z350 according to EN 10147 or zinc coating according to EN1461 with a minimum thickness of 55 μm .

The metal fasteners must also have a zinc coating according to EN ISO 2081 corresponding to the relevant service class 1, 2 or 3 of EN 1995-1-1.

3.6 General aspects related to the fitness for use of the product

The performances given in this ETA are based on the following:

- The timber post
 - shall be restrained against rotation, and supported at the lower and upper end
 - shall be strength class C24 or better according

to EN 338:2016

- shall be free from wane in the post base
 - must fulfil the requirements regarding minimum dimensions (see Annex A)
 - end grain must in general be plane on the base plate or spacer of the post base or at a maximum distance given in Annex A.
- The post base shall be installed centrically in the cross-section of the timber column.
 - The actual end bearing capacity of the timber member to be used in conjunction with the post base is checked by the designer of the structure to ensure it is not less than the post base capacity and, if necessary, the post base capacity reduced accordingly.
 - There are no specific requirements relating to preparation of the timber members.
 - The minimum insertion depth in the turnbuckles should be the diameter of the rod.
 - The base plates of the post bases with steel tubes as support must in general be plane on the tube's end.
 - The anchorage of the post base in the foundation is not part of this ETA. It must be checked by the designer of the structure to ensure it is not less than the post base capacity and, if necessary, the post base capacity reduced accordingly. Therefore, the specifications for the lever arms $e_{F2/F3}$ (for load case F₂ / F₃) and $e_{F4/F5}$ (for load case F₄ / F₅) in Annex A have to be considered. The lever arm is the distance between the top edge of the foundation and the load.

4 Attestation and verification of constancy of performance (AVCP)

4.1 AVCP system

According to the decision 97/638/EC of the European Commission¹, as amended, the system(s) of assessment and verification of constancy of performance (see Annex V to Regulation (EU) No 305/2011) is 2+.

5 Technical details necessary for the implementation of the AVCP system, as foreseen in the applicable EAD

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited at ETA-Danmark prior to CE marking.

Issued in Copenhagen on 2021-06-25 by

Thomas Bruun
Managing Director, ETA-Danmark

Definitions of forces, their directions and eccentricity

- Force F_1 : tensile or compression load

- Force F_2 / F_3 : horizontal parallel to the ground plate of the post base and perpendicular to the bolts or dowels

- Force F_4 / F_5 : horizontal load parallel to the ground plate of the post base and parallel to the bolts or dowels

Acting forces

F_1	axial force (tension or compression) acting along the central axis of the joint
F_2 and F_3	horizontal force perpendicular to the ground plate of the post base acting with the lever arm $e_{F2/F3}$ above the foundation
F_4 and F_5	horizontal force parallel to the ground plate of the post base acting with the lever arm $e_{F4/F5}$ above the foundation

Combined forces

If the forces F_1 and F_2/F_3 or F_4/F_5 act at the same time, the following inequality shall be fulfilled:

$$\sum \frac{F_{i,Ed}}{F_{i,Rd}} \leq 1$$

The forces F_2 and F_3 or F_4 and F_5 are forces with opposite direction. Therefore only one force F_2 or F_3 , and F_4 or F_5 , respectively, is able to act simultaneously with F_1 .
